

Topic:	Addressing the rise of cyber-nuclear threats to achieve global security
Main Submitter:	DPRK
Co Submitters:	People's Republic of China, Russian Federation, Islamic Republic of Iran
Signatories:	Kingdom of Cambodia, Malaysia, Islamic Emirate of Afghanistan, Islamic Republic of Pakistan, Republic of India, Federal Republic of Nigeria, Türkiye, Socialist Republic of Vietnam, Republic of the Union of Myanmar, Republic of Indonesia, United Arab Emirates.

The Counter Terrorism Committee,

Realizing the threat posed by cyber-nuclear attacks to military and civilian infrastructure,

Pointing out that cyber-nuclear offensive operations create a dangerous international environment,

Deeply concerned about the potential escalation of conflicts and even a nuclear war,

Having studied the fragility and the vulnerabilities of nuclear facilities and cybersecurity systems,

Deeply concerned by the massive misuse of nuclear weapons,

Acknowledging the terrible consequences of cyberattacks,

Emphasising the importance of international collaboration to solve potential cyberattacks,

Observing the rise of nuclear terrorism and cyberattacks targeting critical infrastructure worldwide,

Deeply disturbed by the danger that cyber-nuclear attacks pose to a sovereign nation,

Aware of the consequences of neglecting the current state of cybersecurity,

Fully alarmed by the high average response time needed to find and resolve cyber attacks on all potential targets, including nuclear weapon storage or energy generation facilities,

Taking into account the dangers that currently ongoing terrorist threats pose to all security measures, including cybersecurity,

1. **Suggests** the creation of a global monitoring framework under UN supervision for:
 - a. identifying and reporting cyber threats to nuclear power plants,
 - b. offering real-time information exchange during incidents,
 - c. supporting early alert systems for possible attacks,
 - d. supporting the development of an international commission that establishes several laws that include:
 - i. forbidding cyberattacks on civilian nuclear plants,
 - ii. strengthening each and every nation's liability in preventing cyber attacks,
 - iii. establishing accountability for actors involved in the attacks,
 - e. making sure they respect each and every country's sovereignty;
2. **Hopes** that every member state is going to contribute and help with military resources in case of a conflict with another state;
3. **Proposes** that signatory states, at their discretion, improve on-site physical vetting and security systems of nuclear plants, in order to prevent any breaches through the use of third-party devices that may contain malicious files, implemented as such:
 - a. A specialised security force deployed only by the state itself should be appointed to all access points of the facility in order to check all personnel or visitors for electronic devices that may be at risk, such as personal smartphones, laptops, or any other such devices, taking into account the following situations:
 - i. In case any such devices are found on a person, security personnel will then escort them to a specialized IT department for turn-in,
 - ii. Security will subsequently run a scan through the internal storage in order to find any potential threats such as system override scripts, alarm silencing and so on, which will then be promptly deleted,
 - iii. Upon exit, personnel or guests will be directed back to the turn-in point to recover their now secured devices,
 - iv. In case of delays regarding handing back the devices, waiting zones will be set up accordingly,
 - b. The administration of any nuclear plant should be required by legislation to acquire new devices solely for the proper operation of the facility, in order to aid digitalization while preventing cyber attacks, which:
 - i. should ideally be handled by the aforementioned IT department, which will be tasked with installing a specialized operating system designed around the proper operation of the site,

- ii. shall be handed to all personnel or guests inside the facility, once personal devices have been handed over,
 - iii. shall be handed back to the department, which will then let the owner have access to their personal devices again, upon exit,
 - iv. will be subjected to a security check, once in storage, to see if any threats somehow made their way inside the facility, followed by an emergency search of all operating stations inside the facility to check for any potential damages that require immediate solutions;
- 4. **Affirms** that any cyberattack through a supply chain compromise directed against any nuclear command systems, early warning systems, or other critical infrastructure are considered a serious threat to international and national peace and security and can lead to unwanted escalation or accidental nuclear use, whether they refer to any of the following:
 - a. espionage,
 - b. intrusion,
 - c. disruption;
- 5. **Suggests** the reestablishment of the START treaty, that should also include other top nuclear powers, such as the People's Republic of China, taking into consideration the fact that the absence of the treaty makes it harder to distinguish between a routine cyber-espionage operation and a cyber-attack aimed at disabling nuclear command and control systems, on condition that the United States of America stops any hostile help and military support for Ukraine and the help from the Democratic People's Republic of Korea to the Russian Federation ceases, and it should include:
 - a. The weaponization of information space and the Western technological aggression that threaten Eastern sovereignty, including all weapons that affect strategic stability,
 - b. On-site inspections, up to 18 per year, data exchanges, notifications, unique identification tags on each missile and bomber, and national technical means, such as satellites,
 - c. Creating a forum to resolve implementation issues, and in the event of creating a new kind of strategic weapon, it should be announced on the forum;
- 6. **Suggests** the creation of an International Cyber-Nuclear Attribution and Assessment Mechanism (ICNAAM) as United Nations body, that would ensure that all investigations into cyber incidents affecting nuclear related facilities are impartial and will:
 - a. conduct evidence based investigations into cyber-attacks on nuclear command, control and civilian facilities,
 - b. apply high standards of attribution based on multiple source digital forensics, along with the use of an independent expert review, in order to eliminate politically motivated accusations,

- c. operate under the principles of sovereignty, non-interference, and technical transparency while maintaining the confidentiality of sensitive information to a state,
 - d. promote strictly voluntary participation of member states by supplying technical consultations under mutually agreeable terms;
- 7. **Encourages** the idea of initiating more programs regarding the measures that need to be taken in case of a cyberattack using UN grants, which would primarily focus on:
 - a. Offering advanced courses on defence in case of any cyberattack, which would be held both in military bases (to prevent loss of data such as total arsenal or military strategies) and in nuclear facilities, prioritising countries with the least developed cybersecurity for these programs, which will subsequently benefit from special attention until they reach an acceptable level of security,
 - b. Increasing the number of countries benefitting from up-to-date firewalls, so that every state would be able to eliminate most of the currently used old ones in around 20 years, with primary focused on countries who suffer from a poor economic status,
 - c. Solving the issue of the significant decrease in the number of skilled cybersecurity professionals, a problem most states are currently facing, which cannot be overseen,
 - d. Training the workforce to protect national infrastructure by training the young population to become experts in cybersecurity by:
 - i. encouraging the pursuit of computer sciences in college,
 - ii. raising the budget for salaries in this specific domain to attract youngsters,
 - iii. offering bootcamps specially designed to train such workforce;
- 8. **Calls for** measures to improve the transparency of the progress of the de-escalation of cyber-nuclear threats made by states and strengthen the cooperation between countries, by:
 - a. Increasing cooperation between states and voluntary data sharing, especially nuclear-armed ones, to adopt equal transparency standards,
 - b. Straightening mechanisms with the purpose of international data sharing in order to ensure protection concerning sensitive data along with respecting and protecting the sovereignty of each member country;

9. **Endorses** the importance of strengthening national legal frameworks regarding cyber-nuclear attacks by:
 - a. Looking for accountability of:
 - i. Individuals who have committed or attempted a cyber-nuclear attack,
 - ii. Groups who have committed or attempted a cyber-nuclear attack,
 - iii. Involved states in committing or attempting cyber-nuclear attacks,
 - b. Developing stricter laws,
 - c. Defining cyber-nuclear attacks;
10. **Supports** the creation of a Cyber UN for the virtual space by:
 - a. hiring a committee of the best international experts in cybersecurity for creating it,
 - b. engaging representatives from countries affected by attacks to take part in the broadcasting of the Cyber UN,
 - c. making it accessible for everyone in order to gain credibility,
 - d. developing a Cyber UN set of rules with laws that should be respected by all the members,
 - e. promoting the creation of an audit department of Cyber UN by:
 - i. supporting contributing countries to take part in the verifications voluntarily,
 - ii. establishing a neutral certification mechanism to confirm that verifications have been conducted respecting international law,
 - iii. supporting clear procedures that strengthen trust;
11. **Encourages** cooperation with global communication and intelligence hubs with the purpose of combating cyber-nuclear terrorism, by:
 - a. Encouraging real-time sharing of intelligence with the purpose of facilitating the apprehension of cyber-terrorists,
 - b. Giving states the possibility to conduct joint operations which:
 - i. will be crucial in overcoming jurisdictional obstacles in the cases of cross-border attacks,
 - ii. will be directed at monitoring digital markets on the Deep Web in order to trace cyber-terrorists acquiring tools for their illegal activities;
12. **Calls for** the initiation of negotiations under the UN to establish an international framework, aimed at preventing the use of cyberspace for attacking, espionage activities and hostile activities targeting nuclear infrastructure, by:
 - a. developing the peaceful use of cyberspace,
 - b. preventing its militarization in relation to nuclear systems,
 - c. encouraging all member states to refrain from
 - i. cyber attacking,
 - ii. espionage activities that can compromise nuclear security;

13. **Endorses** capacity-building initiatives, overseen by the UN resolution, with the assistance of developed countries and relevant international organisations to help LDCs and developing states in order to provide technical assistance training programmes, and cybersecurity resources, such as, but not limited to:
 - a. Protection of critical infrastructures and facilities that might be targeted by hackers or cyber-terroristic attacks,
 - b. Emphasizing knowledge-sharing initiatives among member countries, which:
 - i. will be voluntary,
 - ii. will not come with any sanctions for states which will not engage in,
 - iii. will be made in a way that assures the respect of every and each nation's sovereignty,
 - c. Financial disbursement and the distribution of mechanisms to facilitate LDCs and developing countries in implementing cybersecurity precautionary systems;
14. **Calls for** the harmonization of legal frameworks internationally in order to facilitate cooperation on cybercrime investigations, by:
 - a. Making national laws compatible with each other in order to improve the efficiency of prosecuting cross-border offenses,
 - b. Establishing common standards for data protection and evidence collection;
15. **Supports** the development of a UN protective software under the UN supervision by:
 - a. creating a commission of the best IT specialists in the field for its development,
 - b. establishing a team of experts to prevent it from malwares,
 - c. hiring IT specialists that should develop the software,
 - d. reviewing it monthly to prevent it from malware,
 - e. ensuring its preservation and possible changes for the future;
16. **Suggests** that Member States perform surveys on every facility to ensure cybersecurity is being properly maintained and working as intended by:
 - a. Implementing hardware designed to mitigate software vulnerabilities in outdated equipment by:
 - i. integrating analog sensors as backup that operate independently, which cannot be accessed from the outside,
 - ii. installation of physical-only measures such as manual-overrides to prevent remote manipulation that is not authorised,
 - b. Modernization of the cybersecurity protocols periodically to ensure the software architecture will not be outdated and vulnerable to outside attacks,
 - c. Recommending weekly dual control verifications by:
 - i. Conducting inspections done by a whole team of IT specialists,
 - ii. Establishing a protocol so the security check cannot be validated;

17. **Calls for** the adoption, by Member States, of a “No-First-Cyber-Strike Against Nuclear Infrastructure” doctrine, consisting in voluntarily committing to:
- a. not initiating any cyber operations with the intent of causing damage or disruption to Nuclear Command Control and Safety Systems of other Nations unless engaged in armed conflict,
 - b. treating cyber operations interfering with Nuclear Infrastructure as a threat equal to existing nuclear security threats causing loss of Nuclear Security or destabilization of Nuclear Security,
 - c. establishing confidential communication lines solely for the use of preventing misunderstanding between nuclear Member States regarding malfunctions in the technical component of the nuclear command,
 - d. encouraging States to build trust and reduce the risk of damaging cyber actions through reciprocal transparency regulations, on a voluntary and sovereignty-respecting basis;
18. **Encourages** nuclear-armed states, on a voluntary and progressive basis, to reallocate part of the sources currently devoted to nuclear programmes towards research and the development of non-nuclear defensive cybersecurity capabilities, including but not limited to:
- a. Advanced defensive technologies such as early warning systems regarding cyber-nuclear threats and detection, defence mechanisms and missile-interception systems,
 - b. Electronic and cybersecurity defensive programs, aiming to:
 - i. Safeguarding sensitive data and private informations,
 - ii. Reducing the need for nuclear arsenal,
 - c. Adopting de-escalation technologies, including platforms that serve as an intelligence sharing mechanism, such as shared early-warning data in order to exchange limited pre-agreed data on nuclear missile launches, and indicators regarding cyber incident, incident-reporting and verification systems with the purpose of securing mechanism aiming to report cyber-incidents, unsure events being clarified and reducing the misinformation during crises;
18. **Proposes** the development of a specialized cybersecurity education and training program to safeguard nuclear digital infrastructure, including:
- a. scholarships for computer scientists and nuclear engineers, funded by the state in which the training centre is located,
 - b. cyber-incident simulations coordinated by relevant agencies to prepare for real life emergencies;
19. **Recommends** the implementation of an “integrity system” in all nuclear command centres to detect cyberattacks by performing a threat check of all software updates on all electronic devices, which will include a:
- a. ensuring a system will flag if there is a potential malware which will be sent to the IT department for review,

- b. integrating hardware that will detect any error in the system which will alert as fast as possible the on-site personnel;
- 20. **Proposes** to cease the development of artificial intelligence in the domain, therefore reducing the risk of mistakes and cyber intrusion, while also boosting the migration chain for the affected country by opening up job positions in the industry;
- 21. **Suggests** employing qualified human personnel to supervise already existing artificial intelligence used for cybersecurity in order to spot a mistake or a potential intrusion before it escalates;
- 22. **Expresses its** hope that all Member Nations' sovereignty will be respected in decision-making concerning the matter at hand due to:
 - a. previous agreements such as:
 - i. The United Nations Charter,
 - ii. The said countries' constitution,
 - iii. The Asean Charter,
 - b. possible negative outcomes of overregulation and misconduct,
 - c. cultural, political and economic differences between certain states;
- 23. **Calls for** all developed Member States to provide financial and technical assistance to nations with limited cybersecurity capabilities to ensure that no nuclear facility anywhere in the world remains inadequately protected due to a lack of resources, by:
 - a. establishing the CUM (Cybersecurity Upgrade Mechanism) fund through which developed nations contribute proportionally to a shared pool of resources available to less developed Member States for the purpose of upgrading their nuclear cybersecurity infrastructure,
 - b. organizing regular capacity building workshops and technical training programs through which cybersecurity expertise is transferred directly to personnel from nations with developing nuclear programs, ensuring that knowledge and capability gaps are systematically and sustainably reduced over time;
- 24. **Encourages** all governments to enforce rigorous verification protocols for all hardware and equipment introduced into nuclear facilities by mandating cryptographic authentication of firmware and software present in all nuclear facility systems to ensure that only verified and untampered components are authorized for operational use requiring independent auditing of component origins conducted by internationally recognized third-party cybersecurity bodies, ensuring full supply chain transparency before any equipment is cleared for installation within nuclear facilities, by means of:
 - a. developing a standardized global registry of approved vendors and manufacturers whose products have successfully passed origin verification assessments,

- b. enforcing mandatory disclosure of the full production and distribution chain for all hardware components, with particular scrutiny applied to those originating from jurisdictions with limited oversight frameworks,
- c. neutralizing risks posed by pre-compromised devices through testing environments in which all incoming equipment must undergo comprehensive threat analysis prior to deployment;

25. **Further recommends** to all signatory countries to start raising awareness about the dangers of nuclear weapons and cybernetical attacks internally through:

- a. Programmes in schools that promote how to be secure cybernetically and explain the scale of nuclear disasters,
- b. Media campaigns to understand the frequency of cyberattacks.
