

Committee:	ECOFIN
Issue concerning to:	Assessing the impact of artificial intelligence technologies on global labor markets and economic stability.
Main Submitter:	Swiss Confederation
Co Submitter:	Kingdom of Saudi Arabia, United Mexican States, Republic of Colombia
Signatories	Republic of Finland, Malaysia, The Netherlands, People's Republic of China, Commonwealth of Australia, India, France, Germany, Spain, Argentine Republic, Italy, Russian Federation, United Arab Emirates, Republic of Korea

The Economic and Financial Affairs Council,

Acknowledging the rapid development of AI in all sectors of the economy, with special emphasis on labour markets,

Emphasising the importance of combining financial education, legal frameworks and digital access in solving the matter,

Deeply concerned by the risks associated with inadequately regulated AI frameworks,

Taking into consideration the widening economic divide within rural areas due to the implementation of AI in the economic ecosystem,

Alarmed by the growing unrest caused by the replacement of entry level jobs due to the implementation of AI technology,

Emphasising the importance of upgrading people's skills who are negatively affected by the inclusion of AI in their job,

Aware of the responsibility of the state to ensure a well-rounded framework in the educational system to prepare the population for any negative effects caused by AI,

Fully alarmed by the proposition that AI integration will eliminate the youth's entry-level job opportunities,

Acknowledging the need for an updated international framework aimed at mitigating the economic influence of AI integration,

Viewing with appreciation the contributions made by the OCDE on the matter of AI,

1. **Further recommends** the creation of an Informal Workforce Reduction Agency (IWRA), to solve one of the world's biggest problems, as about 2 billion people across the globe are in the illegitimate workfield, which in turn creates even more problems:
 - a. we believe we must first define "informal workers" as workers who are not registered with the government, who do not pay taxes, who do not have insurance, and who are susceptible to abuse, but also to committing illicit activities themselves,
 - i. these workers are a liability to the government, and a huge burden to the economy,
 - ii. furthermore, because of their number, with any economic change, such as the one discussed in the topic, implementation is much slower, and the government simply cannot grant them protection, which is evidently problematic, as a large part of the workforce (the illegitimate one of course), can virtually disappear overnight because of this changes, which would obviously be catastrophic to the economy,
 - b. the aim of this agency would be to help reduce the number of illegitimate workers in each country, and ensure that they get contracts verified by the government, while also being protected by the state, with the afore-mentioned solutions;
2. **Encourages** developed countries with great financial resources to launch initiatives and provide aid in order to launch initiatives and provide aid to developing countries to promote AI technologies on bases such as respect and mutual support;
3. **Seeks** to solve the withdrawal of large tech companies such as Meta from states which deal with policies regarding the protection of workers, which limit above-mentioned companies' power to implement AI tech with the purpose of and by:
 - a. preventing global economic destabilisation due to failed partnerships between large-private investors and governments, vital to the development and implementation of AI technologies in said countries,

- b. creating the International Artificial Intelligence Discussion Forum (IAIDF), which will be composed of specialists from big tech companies and scientists from governmental institutions, to encourage dialogue, and establish policies that would benefit both the investors and the governments, to avoid clashes between interests and implementation policies,
 - c. promote the increasing of not only digital, but also artificial intelligence literacy;
- 4. **Proposes** that member states join together to create an International Reskilling Program (IRP) with the purpose of creating internationally adopted laws and policies that would guide countries who struggle with implementing AI technologies due to the low skill of workers in modern AI technologies which will also:
 - a. monitor the skill level of workers and their adaptation to the new hardships of AI, ensuring a smooth transition and proper adaptation for all levels of workers,
 - b. collaborate with universities and research institutes of each country to create AI training programs based on each country's goals, possibilities and current level of the general population, to aid in the education of the majority of the population,
 - c. to address workforce displacement caused by automation, particularly in vulnerable sectors,
 - d. upskilling programs for the workers with high-risk-jobs and low complementarity, to be able to collaborate with this technology,
 - e. Implement a system designed to measure the success rate of worker transitions after the enactment of AI education and training programs, meant to measure the workers' success in augmentation in the assigned field;
- 5. **Expresses its hope** upon members states to create and support an International Workforce Shock Protection Fund (IWSPF) with the purpose of and by:
 - a. protecting workers from any unexpected situations that may arise related to AI implementation situations, but also to enable nations to effortlessly protect their workers against any presently undergoing problems, such as the disappearance of small and medium-sized farmers (which are absolutely crucial to the economic backbone of not only national economy, but also regional and international communities):
 - i. by presently undergoing situations we understand pressure applied on governments by large, private sector investors, who try to rush implementation processes, disregarding human safety and job loss,
 - ii. by adopting Individual Labour Mobility Accounts globally, which act as a "safety net", employers depositing a small amount of money (3%-8% of the salary) into a personal account for the worker and if they get replaced by artificial intelligence later on, they won't have to

sue the company and the company won't have to pay a huge amount of money. This "safety net" will provide financial stability for the employee until finding a new job,

- b. voluntary, scalable contributions based on GDP and national economic capacity, coordinated through international financial institutions such as the IMF and World Bank with the right to access this fund at any given time to resolve any of the above mentioned problems, but only under the supervision of a Fund Management Commission (FMC), which after carefully assessing the problem and situation of a given country, and after discussing with the respective government, will allocate a certain amount of money to solve said problem;
6. **Calls for** artificial intelligence not to have any access to personal GDPR data, under no circumstances, as this could be a threat of exposure;
7. **Proposes** the establishment of a telephone line for any person who might be experiencing any misuse or AI- related mistakes in their work environment:
 - a. the phone line will be under the supervision of the United Nations,
 - b. this ensures a stable safety net for employees vulnerable to the constant changes of AI policies by:
 - i. ensuring their freedom to report changes that are directly affecting them or a colleague,
 - ii. this is a solution for any AI- related changes that are implemented by the company, that do not align with the laws and regulations imposed by the state,
 - c. if any employee is in danger of unemployment due to improper practices of the company, they can report directly;
8. **Recommends** for all AI systems to be categorized by the Artificial Intelligence Categorisation Council (AICC), a recognised body within the UN, after the level of risk that certain systems provide, with higher-risk systems being met with stricter transparency requirements:
 - a. AI systems, such as autocorrect, and autocomplete, categorized by low-risk results, will be classified as "Low Risk",
 - b. AI technologies, resembling marketing tools, categorized by medium-risk consequences, will be classified as "Medium Risk",
 - c. Artificial Narrow Intelligence, like healthcare diagnostics, categorized by high-risk results, will be classified as "High Risk";

9. **Invites** member states to join under one International Artificial Intelligence Strategy (IAIS), encompassing the needs of all member states while actively working towards:
- a. one universal set of regulations and policies, prioritising:
 - i. the responsible use of artificial intelligence in the workforce,
 - ii. the establishment of future-proof solutions after careful analysis of risks and consequences,
 - iii. transparency frameworks regarding the AI development and deployment,
 - iv. the protection of global worker rights,
 - v. but restraining from creating excessive regulatory fragmentation that could create barriers to cross-border innovation and economic competitiveness,
 - b. reskilling and training talent for future jobs enabled by AI,
 - c. research in AI technologies by:
 - i. the construction of data centres in all member states,
 - ii. investing in AI research facilities;
10. **Supports** the implementation of provisions on AI technologies in international trade agreements through the adoption of a universal ethical trade framework for AI by:
- a. preventing the monopolization of foundational AI technologies,
 - b. allowing all nations to harness AI for domestic economic growth,
 - c. strengthening the importance of human integration and cooperation in the job sector in order to avoid the potential of mass job replacements because of the misuse of artificial intelligence;
11. **Encourages** artificial intelligence to be integrated into high-risk occupations that could cause permanent casualties to humans, with the objective to:
- a. Reduce the percentage of humans harmed during work hours,
 - b. Lower the percentage of mistakes that could be made by humans,
 - c. Rise productivity and efficiency;
12. **Affirms** the creation of an international agency named IAAI (International Agency for artificial intelligence) that verifies the AI systems implemented, more precisely, it will:
- a. verify that the AI systems are not discriminating certain groups of people,
 - b. confirm that the companies are using the AI systems as declared and for good purposes - the companies need to explain how the artificial intelligence systems implemented function,
 - c. if the the company does not pass the agency's inspections, it will be imposed sanctions, like:
 - i. suspending the activity for a certain amount of time,

- ii. the company will receive a fine;

13. **Recommends** the establishment and strengthening of lifelong learning frameworks in cooperation with private sector actors and educational institutions, in order to ensure continuous labour market adaptability, including:

- a. the development of modular and flexible learning systems, allowing workers to periodically update their skills without leaving the labour market that will include:
 - i. the integration of artificial intelligence literacy, digital skills, and data analysis competencies,
 - ii. the creation of publicly funded vocational retraining programmes targeted at workers in sectors most exposed to automation, such as administration, customer service, and routine knowledge-based occupations,
 - iii. incentives for private sector participation in continuous employee training programmes,
- b. the recognition and certification of informal and digital learning pathways to facilitate professional mobility,
- c. the expansion of accessible online and hybrid education platforms focusing on emerging AI-related competencies through:
 - i. facilitating access to said online platforms for those who cannot access them because of lack of skills or because of other social circumstances,
 - ii. implementing AI-powered assistive technologies, such as Microsoft Education's reading tools, real-time captioning, and speech recognition;

14. **Proposes** raising awareness about the uses of AI to the general population by:

- a. emphasising the advantages and disadvantages that artificial intelligence brings in the workforce,
- b. notifying users about how their data is processed and used,
- c. apprising the opportunities that the use of AI as a tool opens up, targeted towards business owners and entrepreneurs;

15. **Suggest** the creation of a sub-body under the IWRA control, named Artificial Intelligence Technical Support (AITS) that will work on the problems that have been reported through the telephone line system, by:

- a. collaboration among the nations members of IWRA,
- b. technical support given by experts of IWRA, that will collaborate to find solutions for the problem,
- c. respecting the rules proposed by IRP;

16. **Supports** the creation of structured public-private partnerships aimed at facilitating the transition of the workforce in the context of AI adoption, including:
- a. collaboration between governments, universities, and technology companies to design AI-specific training and certification programmes aligned with market needs,
 - b. the establishment of innovation hubs and training centres focused on applied artificial intelligence in key economic sectors such as finance, healthcare, and industry,
 - c. internship programmes designed to integrate young workers into AI-transformed labour markets;
17. **Affirms** the idea that countries should also create social protection programs to replace the market-driven ones, because:
- a. they are not promoted by companies that only want profit but by countries that want the best for their population,
 - b. they are not decided by a few people from a few companies,
 - c. they can be implemented with the help of the government.
